Question: Compute the greatest common divisor of 84 and 30, then add 4.

(1) CoT-agnostic: generic-text (C4)

The gcd of 84 and 30 is 30.
Then add 4, so the answer is 34.
30. 30. 30. 30. 30. ...
34. 34. 34. 34. 34. ...
[repeats and loses structure

(2) CoT-agnostic: domain-specific

Use the Euclidean algorithm.
84 = 30 \cdot 2 + 24
30 = 24 + 6
24 = 4 \cdot 6
So the gcd is 24.
Then 24 + 4 = 28.
Final answer: 28

(3) CoT-aware: stronger-LLM-generated

<think></think> <think>
I should compute the gcd first and then add 4. The Euclidean algorithm should make this straightforward, so I will reduce the pair step by step and then add the offset at the end.
</think>
84 = 30 \cdot 2 + 24
30 = 24 + 6
24 = 6 + 0
So the gcd is 6.
Final answer: 6

(4) CoT-aware: self-generated

<think>
Okay, so I need to find gcd(84, 30) first, and then add 4. The safest way is the Euclidean algorithm.
84 = 30 \cdot 2 + 24
30 = 24 + 6
24 = 6 \cdot 4 + 0
So the last nonzero remainder is 6.
Then 6 + 4 = 10.
</think>
Therefore, \gcd(84,30)=6, and after adding 4 the result is 10.
Final answer: 10
