

Goal:

arrange the blue moon, the yellow star, and the red moon into a V-shape

Reasoning: ... To form the V-shape, I can place the blue moon and the red moon as the top horizontal points and the yellow star as the bottom vertex. However, looking at the current positions, the blue moon is at the bottom center... **Alternatively**, I can keep the blue moon at the bottom center as the vertex and move the red moon and yellow star to form a horizontal line above it... I will move the red moon to the top right to form the horizontal line with the yellow star, but wait, the yellow star is lower than the red moon's current position. **Let's reconsider.** A V-shape with the blue moon at the bottom center... I should move the red moon to the top right to form a horizontal line with a future placement of the yellow star, or move the yellow star to the top right... ***Instruction:*** move the red moon to the top right of the board.
