

Goal:

build a T-shape with all the blue
and red blocks

Reasoning:... There is no horizontal blue block currently at the base of the blue cube. However, there is a red pentagon that is currently adjacent to the red moon. **Wait**, looking closely at the specific instruction "red pentagon to the top side of the blue cube", looking at the image, the blue cube is part of a vertical stack. But the instruction is actually to place a block on top. **Let's re-evaluate** based on the strict instruction format... The specific previous instruction was "move the red pentagon to the top side of the blue cube". This implies the red pentagon is currently elsewhere and needs to go there. In the image, the red pentagon is lying flat near the red moon. The blue cube is in a vertical stack. To execute the goal of building a T-shape, placing the red pentagon on top of the blue cube would stack them vertically, but maybe that's not the top of the T. **Let's look at the blocks again.** There are two blue blocks (one cube, one moon) and two red blocks (one pentagon, one moon)...

Instruction: move the red pentagon to the top of the blue cube
