

Goal: Move the gelatin box from the medium tray to the small tray, then pack the foam brick into the small tray

Reasoning: ...The left tray is smaller and empty except for a small reddish mark, while the right tray is larger (medium) and contains a red gelatin box. There are also other objects scattered: a blue foam brick, a white cylindrical object, and robotic arms on both sides. The second and third images show the close-up views from the left and right wrists respectively, confirming that the grippers are positioned near the edge of the table but not yet interacting with specific items in a way that suggests an ongoing task like holding an object. The long-horizon goal states to move the gelatin box from the medium tray to the small tray, then pack the foam brick into the small tray. Currently, the gelatin box is in the medium (right) tray, and the small (left) tray is empty. The immediate next step in the sequence to achieve the long-term goal is to transfer the gelatin box from the medium tray to the small tray. The robot's current position, as seen in the wrist views, is hovering over the table surface near where the trays are located, which is appropriate for initiating this transfer action. Therefore, the short-horizon instruction should command the robot to perform this specific transfer.

Instruction: Transfer the gelatin box from the medium tray to the small tray
